

SECRID

designed and made in Holland

Secrid wallets

The Cardprotector is the secure heart of the Secrid wallet. With one simple movement, your cards slide out of the Cardprotector in overlapping order. Thus, even without opening your wallet, you can easily access all your cards and find the card you are looking for at a single glance. In addition, your most important cards are protected by the innovative Cardprotector. The Secrid collection consists of different types of wallets that vary in size, offering extra space for additional cards, business cards, traditional paper money, a few coins or a key.

Cardprotector

The ultra thin Cardprotector, made of aluminium, protects your cards from bending and breaking. Moreover, it prevents wireless identity theft by acting as a firewall for your RFID and NFC cards. The Cardprotector features an innovative sliding system: with just one simple click all the cards will slide out gradually, ready for use. Depending on whether the cards are embossed or not, the Cardprotector can hold four to six cards. It is an outstanding combination of design and engineering that has been awarded prestigious prizes, amongst others the Red Dot Design Award.

Cardslide

The Cardslide is the latest addition to the Secrid family. It consists of the Secrid Cardprotector and a high-grade plastic slide, held together by a durable elastic band. The extendable slide offers additional space to hold necessities like parking tickets, cash, a key or photograph. The Cardslide also makes for a great business card holder.

Miniwallet

The name really says it all: the Miniwallet is tiny and fits easily in any pocket or purse. However, due to the clever design you will be surprised how much it holds. The Cardprotector can hold four to six cards, depending on whether the cards are embossed or not. The leather interior of the Miniwallet offers sufficient space for at least four additional cards, business cards, paper money and coins.

Slimwallet

Unlike the Miniwallet the Slimwallet does not have a press stud. This makes the Slimwallet even slimmer. Due to its slimness it fits perfectly into the breast pocket of a jacket. Since the Slimwallet's leather cover has a wider cut, the wallet offers space for at least an additional six cards, paper money and business cards in the leather interior.

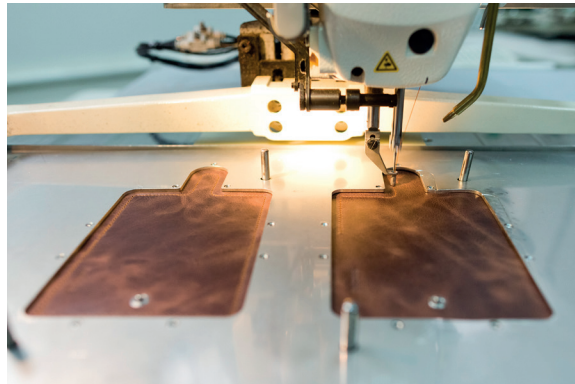

Twinwallet

The Twinwallet has twice the storage capacity, as it features a double Cardprotector. The double Cardprotector can hold eight to twelve cards. The leather interior of the Twinwallet offers enough space for about four extra cards, receipts and business cards.

Made in Holland

Secrid cares about working conditions, quality and environmental issues. That is why all Secrid products are designed and manufactured in the Netherlands under the highest environmental and working standards. This is possible since we have developed our production process in close collaboration with our manufacturers. We work with specialist manufacturers such as a modern leather studio housed in a historic warehouse in the heart of Schiedam. The employees of a social enterprise in Leiden assemble our products with great enthusiasm and precision. In the production process, original materials are combined with modern technologies, ensuring good working conditions and high quality products. That is why we are proud to offer a two-year guarantee on all of our Secrid products.

Founders Secrid

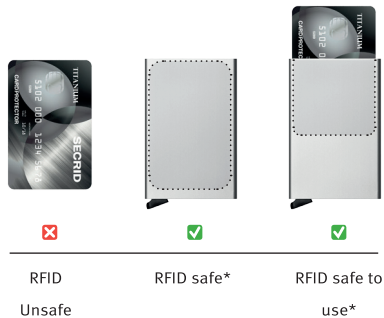

Change is the only constant in life. Coins and paper money have served as the primary method of payment for centuries. The arrival of high-tech cards caused a rapid replacement of these traditional means of payment. This new era of technology calls for an innovative type of wallet. One that protects both your privacy and your money. The Secrid wallet does exactly that both in terms of security and style. While safety rests at the heart of all Secrid products, it is as important to design a fashionable wallet that brings delight in its use.

René & Marianne, Founders and Senior Designers

Protect your cards

The latest bank cards, credit cards and ID cards use a RFID (Radio Frequency Identification) chip and an antenna to enable wireless communication. This can be very convenient, however, these RFID-tags can be scanned and skimmed for malpractices. Cards inside the Cardprotector are not scannable. While the cards are slid out of the Cardprotector, the radio signal received is substantially reduced, yet sufficient for usage. Hence, you can safely use your RFID/NFC cards while your privacy is guaranteed.

RFID - NFC

RFID = Radio Frequency Identification
NFC = Near Field Communication

You can recognise cards which make use of RFID technology by these icons:

* Protection is not guaranteed if the transaction terminal itself has been hacked.
